The global Electricity Spot Trading Services market size is predicted to grow from US\$ 3312 million in 2025 to US\$ 5137 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

To address the challenges of volatile prices, the difficulty of real-time supply and demand balancing between power generation and consumption, and the inability of traditional medium- and long-term transactions to accurately match the characteristics of renewable energy output in the electricity spot market, electricity spot trading services have emerged. Since the deepening of electricity market reforms in the early 21st century and the commencement of settlement trials in pilot provinces, the field of electricity market trading and risk management has developed significantly. Currently, electricity spot trading services have evolved into a comprehensive service encompassing day-ahead trading, intraday trading, real-time balancing trading, ancillary service trading, and inter-provincial spot trading. These services are widely used by power generation companies to optimize pricing strategies, by electricity sales companies to accurately manage electricity purchase costs, by large users to directly participate in market transactions, and by renewable energy companies to address output uncertainties. They effectively achieve price discovery, optimize resource allocation, and reduce energy costs for market participants.
