The global Electrified Aircraft Propulsion market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Electric power and propulsion systems enable new ways of air transport. All-electric and hybrid-electric drive systems allow aircraft to fly with power from renewable resources or e.g. fuel cell instead of only fossil fuels, and make new aircraft designs possible. For replacing fossil fuel energy, airplanes can use an electric and hydro-electric drive system. As soon as this technology is improved, this would lead to reducing pollution and fuel consumption. Light Sport and the training aircraft are already powered by electricity which makes them extremely quiet. There are several electric power and thermal management systems developed for making electrified aircraft efficient and for commercial uses. New rules for the new technology with new platforms and aviation systems need to be set up for realizing the full potential of electric propulsion aircraft. In recent years, there has been a significant increase in electric propulsion research and investments in electric aircraft and electric aviation systems. This technology of electrification will lead to a rise in the possibility of more electrified aircraft. The transportation Industry has improved a lot and has made many efforts for reducing the environmental effects. The Aircrafts traveling between European Economic Area are impacted by the European Union's 2003 scheme "Greenhouse Gas Emission Allowance Trading". This scheme talks about reducing and offsetting carbon for International Aviation, which has begun its trial phase in 2021.
