The overhead contact system of electrified railways is a key component of electrified railways and is used to provide electric energy to trains. This system transmits electric energy from the power grid to electric locomotives through the contact between the contact wire and the pantograph, allowing the train to run electrically. The overhead contact system is a special power supply line that provides electric energy to electric locomotives or EMUs. It is erected along the railway and is used to supply power to electric locomotives. It transmits electric energy to electric locomotives or EMUs through moving contact with the pantograph. The overhead contact system is a device that directly transmits electric energy to electric locomotives. As the core component of the electrified railway traction power supply system, it is the artery of electrified railways and urban rail transit.
