The global Electro-Hydraulic Control Valve Group market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The electro-hydraulic reversing valve group is a hydraulic control component, which is composed of an electromagnetic-operated pilot valve and a hydraulic reversing valve. It can control the flow direction and switch of oil in the hydraulic system. The working principle of the electro-hydraulic reversing valve group is to use electromagnetic force to promote the change of the valve core position, thereby controlling the opening and closing state of the valve port, and realizing the circulation, cutoff and flow direction change of the liquid. There are four main types of electro-hydraulic control valve groups: internal control and internal leakage, internal control and external leakage, external control and internal leakage and external control and external leakage. The difference between them lies in the source and destination of the control oil circuit and return oil circuit. The application fields of electro-hydraulic control valve group are mainly hydraulic systems such as machine tools, metallurgy, mining, water conservancy, and ships.
