## Abstracts

The global Electro Hydraulic Thrusters market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Electro hydraulic thruster is a device which develops linear thrust (or force) required to operate the required mechanism. The input to the device is three phase supply. The thrusters are widely used to actuate thruster shoe brakes, commonly used in material handling machines.

The industry trend of Electro Hydraulic Thrusters is influenced by several factors, such as the demand for higher safety, efficiency, and productivity, the adoption of digital and intelligent technologies, and the environmental regulations and standards. The use of electronic systems to control and monitor the thruster operation, such as the input voltage, the output force, the piston position, and the temperature. These systems can also communicate with other devices and networks to enable remote control and data analysis. The improvement of the thruster design and the material selection to optimize the hydraulic performance and reduce the energy consumption. Some models use a self-loading system that eliminates the need for external pumps and hoses. Some models also use a stainless steel tank that resists corrosion and increases durability. The increase of the thruster capacity and the stroke length to enhance the braking capability and flexibility. Some models can reach up to 500 kN of output force and up to 120 mm of stroke length. The diversification of the thruster applications and functions, such as underwater thrusters, jet thrusters, azimuthal thrusters, and injection thrusters. These thrusters can provide different modes of propulsion and maneuverability for underwater robots, ships, and aircraft.
