The global Electro-Static Discharge Coating market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Electro-Static Discharge (ESD) Coating is a specialized type of protective coating that is applied to surfaces to prevent the buildup of static electricity and safely dissipate any electrostatic charges. This is crucial in industries where static discharge can damage sensitive electronic components, ignite flammable substances, or disrupt precision equipment.

Powder coatings lack solvents, giving way to negligible volatile organic compound (VOC) emission into the atmosphere and reducing the risk of combustion during their usage and storage process. In addition, the powder can be easily washed when exposed to human skin, which reduces the risk of health problems for operators. ETFE is excellent in processability and able to form a thick and non-stick film layer with electrical, mechanical and chemical strength. FEP and PFA Coating Powder are low in melt viscosity and excellent in melt fluidity which can give a coating free of pinholes.
