The global Electrochemical Carbon Monoxide Sensor market size is predicted to grow from US\$ 108 million in 2025 to US\$ 150 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

The electrochemical carbon monoxide sensor is a sensor that uses electrochemical principles to detect the concentration of carbon monoxide in the environment. It has the advantages of fast response, high sensitivity, and low cost. It usually consists of electrodes, electrolytes and working electrodes. When carbon monoxide molecules chemically react with the working electrode surface of the sensor, the current or voltage signal generated is proportional to the concentration of carbon monoxide in the environment. By measuring the changes in these electrical signals, the carbon monoxide concentration can be determined.

The upstream core of the industry lies in the supply of raw materials and components, including precious metal catalysts for electrodes (such as platinum and gold), special chemicals for electrolytes (such as sulfuric acid or phosphoric acid solutions), and high-precision packaging materials (such as engineering plastics or ceramics). Electrochemical carbon monoxide sensors range in price from tens to hundreds of dollars, depending on factors such as brand, accuracy, sensitivity, detection range, and application scenario. The industry's gross profit margin is between 30% and 45%.

Electrochemical carbon monoxide sensors are driven by increasingly stringent global safety regulations and environmental monitoring standards. Higher demands for monitoring automotive exhaust emissions, along with their widespread use in smart homes and portable detection devices, have significantly expanded the market for these

sensors. Continuous advancements in sensor technology, such as miniaturization, low power consumption, and extended lifespan, have also accelerated their penetration into various end products.
