The global Electrochemical Graphite Materials market size is predicted to grow from US\$ 10458 million in 2025 to US\$ 37237 million in 2032; it is expected to grow at a CAGR of 17.7% from 2026 to 2032.

Electrochemical graphite materials are battery anode materials based on natural graphite or synthetic graphite and processed through purification, granulation, graphitization, surface coating, classification and other procedures. They are mainly used in lithium-ion battery systems, where they enable the intercalation and deintercalation of lithium ions during charge and discharge. These materials are critical to battery capacity, initial coulombic efficiency, cycle life, rate performance and safety. In 2025, global sales of Electrochemical Graphite Materials reached approximately 3,310 Kilotons, with an average global market price of around 3,230 US\$/Ton. The upstream raw materials of Electrochemical Graphite Materials mainly include natural flake graphite, petroleum coke, needle coke, coal tar pitch, binder pitch, etc. The downstream markets are concentrated in power battery, energy storage battery, etc.

Growth in power battery demand is the most important market driver. Globally, the IEA's Global Energy Review 2026 shows that global electric vehicle sales increased by more than 20% year on year in 2025, reaching 21 million units, meaning that roughly one in every four new cars sold was electric. This indicates that global demand for power batteries remained in a high-growth phase. In China, according to the China Association of Automobile Manufacturers, production and sales of new energy vehicles reached 16.626 million units and 16.490 million units in 2025, up 29.0% and 28.2% year on year, respectively, keeping China in first place globally for the eleventh consecutive year. Meanwhile, data from the China Automotive Power Battery Industry Innovation Alliance show that China's cumulative installed power battery capacity reached 769.7

GWh in 2025, up 40.4% year on year. As power batteries are still dominated by lithium-ion battery systems, and graphite anode remains the most mature and widely used anode material in lithium-ion batteries, rising global EV penetration, continued expansion of China's new energy vehicle production and sales, and growth in installed power battery capacity together provide the main support for demand growth in graphite anode materials.
