The global Electrochromic Rear View Mirror market size is predicted to grow from US$ 74.9 million in 2025 to US$ 97 million in 2031; it is expected to grow at a CAGR of 4.5% from 2025 to 2031.

An electrochromic mirror, also known as an auto-dimming mirror, is a type of rearview mirror used in vehicles that automatically darkens to reduce glare from headlights of trailing vehicles. It uses an electrochromic gel or liquid between two layers of glass. When a voltage is applied, the material darkens, reducing the intensity of reflected light. When the voltage is removed, the mirror returns to its normal reflectivity. This technology enhances driver visibility and safety, especially during nighttime driving.

The industry trend for electrochromic mirrors is moving towards greater integration with other vehicle systems, enhanced performance, and expanded functionality. Beyond basic glare reduction, manufacturers are exploring integrating these mirrors with features like blind-spot monitoring, lane departure warnings, and even camera displays for enhanced visibility. There's a growing focus on improving the speed and range of dimming, allowing for quicker adjustments to varying light conditions. Furthermore, research is being conducted on new electrochromic materials that offer faster switching times, wider dimming ranges, and improved durability. The trend also includes integrating electrochromic technology into other areas of the vehicle, such as side mirrors and even sunroofs, to provide comprehensive glare control. This aligns with the broader automotive industry's focus on advanced driver-assistance systems (ADAS), improved safety, and enhanced user experience. The use of thinner, lighter materials and more energy-efficient designs are also key trends, driven by the need for fuel
