## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

An Electrode Strip is a set of devices that detects the water level in a container containing liquid, such as a water tank. It works in the same way as electrode rods used to detect the water level in receiving water tanks on the roofs of buildings.

Electrode Strips are made of an air-resistant stainless steel stranded wire coated with PVC and a metal fitting for detection.

Splits are attached with screws that bite into the wires of the Electrode Strip, allowing the liquid to pass through and conduct electricity between the split that is flooded and the common split that is attached at the deepest point, which corresponds exactly to the tip of the electrode rod.

The global Electrode Strip market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
