Electrodeionization (EDI) water treatment modules are advanced purification systems used for producing high-purity water in various industries, including pharmaceuticals, electronics manufacturing, and power generation. EDI combines ion exchange and electrochemical processes to remove ions and impurities from water streams continuously and efficiently. The EDI module typically consists of alternating anion and cation exchange membranes, with an electrical potential applied across them. This induces the migration of ions from the water into the resin beds, where they are retained. As a result, the water passing through the module undergoes continuous deionization, producing ultrapure water with low conductivity and minimal contamination. Its classification includes Plate-and-Frame EDI Modules and Spiral-Wound EDI Modules. Applications in Pharmaceutical, Power, Microelectronics and other fields. EDI systems offer several advantages over traditional ion exchange methods, including reduced chemical consumption, lower operating costs, and minimal wastewater generation, making them environmentally friendly and cost-effective solutions for high-purity water production.

The global Electrodeionization (EDI) Water Treatment Modules market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
