The global Electrodeionization (EDI) Water Treatment Systems market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Electrodeionization (EDI) water treatment systems are advanced technologies used for purifying water by removing ions and impurities. EDI employs an electrochemical process that utilizes ion-exchange membranes, ion-selective resins, and an electric field to deionize water. In this process, ions are transported through ion-exchange membranes and attracted to electrodes, leading to their removal from the water stream. The result is highly purified water without the need for chemical regenerants, as seen in traditional ion exchange methods. EDI systems are widely used in industries such as pharmaceuticals, power generation, and semiconductor manufacturing, providing a continuous and efficient means of producing high-purity water for various applications.
