Electrodeionization system (EDI) is a breakthrough water treatment technology to achieve high purity levels with low conductivity to ensure high-efficiency demineralization process. This technology does not use any chemical treatments and often referred to as a water polishing treatment; it is a continuous process to treat the RO permeate. To ensure efficient electrodeionization process, the feed has to be purified by Reverse Osmosis system and should be with low TDS, which helps in achieving very high purity levels. The ion exchange resins help to retain the ions and facilitates to be transported across the ion exchange membranes. To have increased performance, the feed water should be free from CO₂ and other dissolved gases.

The global Electrodeionization Units (EDI) market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
