Electrodeposited nickel foil refers to nickel foil materials prepared under specific conditions by electrodeposition. Electrodeposition methods mainly include direct current electrodeposition, pulse electrodeposition, jet electrodeposition, and nanocomposite electrodeposition. During the electrodeposition process, nickel ions (Ni^{2+}) are reduced to metallic nickel on the cathode surface by electrolysis in the electrolyte, and gradually accumulate to form nickel foil. Electrodeposited nickel foil has the characteristics of high purity, high density, and uniform grain size distribution. By optimizing parameters such as electrolyte composition, electrodeposition temperature, and time, the morphology and structure of the synthetic material can be regulated to prepare nickel foil with excellent performance. Electrodeposited nickel foil is widely used in the production fields of electromagnetic shielding, touch screens, special transformers, special batteries, lithium batteries, energy storage batteries, high-end speakers, etc.

The global Electrodeposited Nickel Foil market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
