Electroless tin plating, also known as autocatalytic tin plating or chemical tin plating, is a surface finishing process used to deposit a layer of tin onto the surface of a substrate through a chemical reaction, without the use of an external electric current. Unlike electroplating processes, which rely on the application of electrical current to deposit metal ions onto a conductive surface, electroless tin plating occurs through a series of chemical reactions in an aqueous solution.

The global Electroless Tin Plating market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
