Quantum dots, also known as semiconductor luminescent nanocrystals, are nanoparticles composed of II-VI or III-V elements. The particle size of the quantum dot is generally between 2 and 10 nm. Because the electrons and holes are quantum confined, the continuous energy band structure becomes a discrete energy level structure with molecular characteristics, which can emit fluorescence after being excited by external energy (light and electricity). Electroluminescence (EL) is the luminescence of quantum dot materials induced by electrons. This paper mainly studies the EL quantum dots.
