## Abstracts

The global Electrolyte Degreaser market size is predicted to grow from US\$ 2362 million in 2025 to US\$ 3616 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

Electrolytic degreasing agents are industrial cleaning chemicals used in metal surface treatment processes. They are mainly used in the pretreatment of metal parts during electroplating, spraying, oxidation, and surface coating. By immersing the metal workpiece in an alkaline cleaning solution and applying an electric current, the hydrogen or oxygen microbubbles generated during electrolysis create a mechanical scouring effect on the workpiece surface. Simultaneously, the chemical action of alkaline components, surfactants, and complexing agents rapidly removes grease, cutting fluid, wax, and dirt, significantly improving the cleanliness of the metal surface and the adhesion of subsequent plating layers. It is an important auxiliary chemical in the electroplating and metal surface treatment industries. In 2025, global sales of electrolytic degreasing agents were approximately 1.38 million tons, with an average unit price of approximately US\$1.75 per kilogram, and the overall industry capacity utilization rate was approximately 76%. The upstream of the industry chain mainly consists of basic chemical raw material companies, including manufacturers of caustic soda, sodium carbonate, phosphates, surfactants, chelating agents, and auxiliaries. The midstream comprises metal surface treatment chemical manufacturers, while downstream companies operate in electroplating, automotive parts manufacturing, electronic component manufacturing, home appliance manufacturing, machinery processing, hardware tool manufacturing, and aerospace parts processing. The industry's average gross profit margin is approximately 23%. The product cost structure is primarily composed of basic chemical raw material costs (approximately 45%), functional additives and formulation additives (approximately 20%), production and

energy consumption (approximately 15%), packaging and logistics (approximately 10%), and R&D, testing, and environmental treatment (approximately 10%). On the demand side, downstream demand includes electroplating of automotive parts, electroplating of electronic connectors, nickel and chromium plating of hardware, aluminum alloy anodizing, pre-treatment of mechanical parts before coating, and surface treatment of precision instruments. Downstream customers include automotive parts manufacturers, electroplating plants, electronic connector manufacturers, home appliance manufacturers, precision machinery manufacturers, and aerospace parts suppliers. In terms of business opportunities, policy-driven factors include the continuous improvement of environmental regulations and clean production standards, which promote the development of low-phosphorus, phosphorus-free, and biodegradable surface treatment chemicals; technology-driven factors include the continuous upgrading of high-efficiency low-foaming formulas, low-temperature electrolysis processes, and environmentally friendly surfactants, which continuously improve product performance and stability; and changes in consumer demand are reflected in the increasing requirements for the cleanliness and reliability of metal surfaces in automotive lightweight materials, electronic product miniaturization, and high-end equipment manufacturing, which drive the continued growth in demand for high-performance electrolytic degreasing agents.

Electrolytic degreasing agents, as irreplaceable pretreatment chemicals in metal surface treatment processes, have a market demand highly correlated with the prosperity of the manufacturing industry. Future growth will primarily come from the continued expansion of the automotive, electronics, electroplating, and high-end equipment manufacturing sectors. With the continuous expansion of production scale in new energy vehicles, consumer electronics, and precision electronic components, the reliance of metal parts on high-quality surface treatment processes is constantly increasing. The application of electrolytic degreasing agents in pretreatment stages such as electroplating, anodizing, and spraying will continue to increase. At the same time, increasingly stringent environmental policies are driving the industry's product structure upgrade. Traditional phosphorus-containing or high-pollution degreasing formulations are gradually being replaced by low-pollution, biodegradable, or phosphorus-free environmentally friendly products, creating new opportunities for chemical companies with R&D capabilities to upgrade their technologies. From an industry structure perspective, the overall technical threshold is not extremely high, but the high-end market has higher requirements for stability, cleaning efficiency, and environmental indicators. Therefore, companies need to establish a competitive advantage through formulation technology, raw material optimization, and process service capabilities. Furthermore, with the popularization of automated electroplating production lines and continuous surface treatment equipment,

customers are more inclined to choose suppliers with stable quality and system solution capabilities. This will drive the industry's transformation from single chemical supply to comprehensive surface treatment solutions. Overall, driven by the upgrading of the manufacturing industry, the promotion of environmental protection policies, and the growth in demand for high-end manufacturing, the electrolytic degreasing agent industry will continue to maintain stable growth in the future. At the same time, technology-based enterprises have great potential for development in the field of high-end surface treatment chemicals.
