The electrochemical ozone sensor is based on the electrochemical principle, using the measured gas to undergo a corresponding oxidation-reduction reaction on the working electrode and the counter electrode of the sensor and release the charge, and form a current through the external circuit. The current is proportional to the gas concentration, so as to achieve the goal. Electrolytic type sensor for quantitative measurement of gas. The electrochemical ozone sensor is mainly composed of an electrode and a reference electrode, which are connected by an electrolyte. When ozone enters the sensor, an oxidation reaction occurs at the anode, and electrons are reduced from the cathode at the same time. The two reactions combine to form a current signal, and finally calculate the concentration of ozone in the air according to the signal size, with fast response speed and high accuracy. It is easy to use, has low use cost and long service life.

The global Electrochemical Ozone Sensor market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
