The global Electromechanical Gyroscope market size is predicted to grow from US$ 983 million in 2025 to US$ 1234 million in 2031; it is expected to grow at a CAGR of 3.9% from 2025 to 2031.

An electromechanical gyroscope is an angular velocity sensor based on the principles of classical mechanics. Its working principle involves a high-speed rotating mechanical rotor, which can sensitively detect the angular motion of the shell in the relative inertial space due to its inertial effect during rotation. This device is widely used to measure and control the angular motion of objects in inertial space. Electromechanical gyroscopes have the advantages of simple structure, high reliability, and stable measurement accuracy. However, since it relies on the rotation of the mechanical rotor, it also has some inherent disadvantages, such as long startup time, preheating requirements, and susceptibility to acceleration. Despite this, electromechanical gyroscopes still play an important role in many fields, such as aerospace, ship navigation, automotive electronic stability systems, etc.

United States market for Electromechanical Gyroscope is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Electromechanical Gyroscope is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
