An EMG activity monitor is a device used to detect and analyze muscle electrical activity in real time. It uses electrodes to capture electrical signals generated by muscles during contraction or relaxation, and converts these signals into visual data or graphics. This instrument is widely used in medicine, sports science, rehabilitation therapy, and biomechanics research to assess muscle health, functional performance, and muscle coordination during exercise. EMG activity monitors help diagnose muscle and nerve diseases, guide sports training, develop rehabilitation plans, and provide key data support in clinical and sports medicine.
