The global Electronic Adjustable Shock Absorbers market size is predicted to grow from US$ 2044 million in 2025 to US$ 4284 million in 2032; it is expected to grow at a CAGR of 11.4% from 2026 to 2032.

The working principle of electronic adjustable shock absorbers is actually similar to that of traditional shock absorbers. When the wheel is bumpy, the piston in the shock absorber will move up and down in the sleeve, and the oil in the cavity will flow between the inner and outer chambers under the force of the piston. At the same time, the oil will also produce resistance to the piston. As long as the size of the resistance during the oil flow process is changed, the size of the piston resistance can be changed, that is, the size of the shock absorber damping. Electronic shock absorbers can change the resistance of the oil in the inner and outer chambers by adding a control valve to change the size of the hole, thereby changing the damping of the shock absorber.

The intelligentization of vehicle suspension system mainly involves electronic adjustable shock absorbers. The electronic control technology of suspension makes passive suspension develop towards semi-active suspension and active suspension. The electronically controlled suspension system is a new type of suspension structure that can meet the two mutually exclusive performance requirements of smoothness and maneuverability by controlling and adjusting the stiffness of the suspension and the damping of the shock absorber or other components. Its working principle is that the sensor collects the suspension vibration signal, vehicle driving status, road surface information and other data and transmits it to the controller. The controller returns the control signal to the actuator according to the designed control strategy, so as to adjust the damping properties and elastic coefficient of the suspension system in real time. With the rapid development of automotive electronic technology, the continuous

enrichment of the functions of the electronic control unit module, the continuous reduction of the cost of sensors and controllers and the continuous improvement of accuracy, it provides conditions for the application of electronically controlled suspension systems.

The electronically controlled air suspension system is a major breakthrough in the automotive suspension industry since the independent suspension was introduced. At present, the electronically controlled air suspension system has begun to be used in commercial vehicles and luxury cars in European and American countries. However, from a domestic perspective, compared with traditional passive suspension systems, electronically controlled suspensions have complex structures, high costs, difficult operations, and high energy consumption, which to some extent hinders the promotion and application of electronically controlled suspension systems. With the development of vehicle control technology, electronic control will gradually replace traditional mechanical control, and electronically controlled suspension will become a development direction of automotive suspension technology.
