The porous ceramic atomizing core of an electronic cigarette is the core component of the electronic cigarette atomization device. It is a new type of ceramic material that has been processed by a special process. The porous ceramic atomizing core has the characteristics of stable high temperature resistance, safety and easy oil conduction, which can bring a more delicate taste and the advantage of preventing oil leakage. The pore size of the atomizing core is generally micron or submicron. This microporous structure is conducive to the heat transfer of the atomizing device oil during the atomization and heating process and to the better dispersion of the oil. At present, the porous ceramic atomizing core has become the standard configuration of the oil-type electronic cigarette, and plays an extremely important role in the atomization process of the electronic cigarette.

The global Electronic Cigarette Porous Ceramic Atomizing Core market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
