Electronic Differential Lock (EDL) is an advanced technology that electronically controls the differential action of the wheels during cornering or off-road conditions to improve vehicle stability and handling.

EDL augments traditional mechanical differential locks by using electronically controlled clutches to vary the amount of torque transmitted to each wheel. This allows for finer control of the distribution of torque between the wheels, particularly when one wheel is on a surface with reduced traction.

Automotive is a key driver of this industry. According to data from the World Automobile Organization (OICA), global automobile production and sales in 2017 reached their
