The global Electronic Endoscope Image Processor market size is predicted to grow from US\$ 2618 million in 2025 to US\$ 3771 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

In 2024, global Electronic Endoscope Image Processor production reached approximately 196k units, with an average global market price of around US\$ 13k per unit. An Electronic Endoscope Image Processor is the core imaging unit of an electronic endoscopy system. It converts the optical signals captured by the CMOS/CCD sensor at the endoscope tip into digital images through amplification, digitization, color correction, noise reduction, sharpening, dynamic range enhancement (HDR), white-balance control and real-time output. The processor integrates high-speed imaging chips (ISP/FPGA/SoC), signal acquisition modules, video encoders, AI analysis modules, image-enhancement algorithms, interface controllers (HDMI, DisplayPort, SDI), light-source control and recording subsystems. Its performance directly determines image resolution, color reproduction, noise level, low-light capability and latency, making it the most critical imaging component in an electronic endoscope system.

Upstream components include CMOS/CCD sensors, ISP/FPGA/SoC imaging processors, video-coding chips, optical filters, main controllers, structural housings and medical-grade power/display interfaces. Key suppliers include Sony, Omnivision, STMicroelectronics, TI, ADI, Ambarella and Xilinx. Midstream manufacturers develop system architecture, PCB boards, image-processing algorithms, enhancement modules, AI-assisted functions (vascular enhancement, edge enhancement, chromo-imaging), thermal design and regulatory compliance (IEC 60601). Downstream users include endoscope manufacturers, hospital endoscopy centers, gastroenterology, pulmonology, urology departments, operating rooms and outpatient procedure centers, supporting

gastrosopes, colonoscopes, bronchoscopes, hysteroscopes and cystoscopes. The annual production capacity of a single-line Electronic Endoscope Image Processor is approximately 7k units, with a gross profit margin of approximately 40%-55%.

Driven by the rising volume of endoscopic procedures, expansion of minimally invasive surgery and rapid development of hospital endoscopy centers, the market for Electronic Endoscope Image Processors is experiencing strong growth. 4K processors have become the mainstream in system upgrades, while AI-enhanced imaging, vascular-highlighting, mucosal-texture enhancement and digital chromo-imaging are accelerating the shift toward high-performance processors. Continuous progress by domestic manufacturers in ISP, algorithms and SoC integration is breaking the long-term dominance of imported high-end processors and enabling cost reduction and market expansion. With early GI-cancer screening programs, ambulatory endoscopy and the rollout of primary-care endoscopy facilities, demand for mid- to low-end processors is increasing, while premium 4K/AI models continue to grow in tertiary hospitals. Overall, this market features strong medical demand, policy support, rapid technological evolution and clear localization trends, and is expected to maintain sustained mid-to-high growth in the coming years.
