According to our LPI (LP Information) latest study, the global Electronic Expansion Valve Controller market size was valued at US$ million in 2023. With growing demand in downstream market, the Electronic Expansion Valve Controller is forecast to a readjusted size of US$ million by 2030 with a CAGR of % during review period.

The research report highlights the growth potential of the global Electronic Expansion Valve Controller market. Electronic Expansion Valve Controller are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Electronic Expansion Valve Controller. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Electronic Expansion Valve Controller market.

Electronically controlled electric valves have been accepted for years in larger applications, the relatively large port and large stroke of the EXV allows them to open wide, purge the flash gas, and then re-establish the desired superheat. The advantages of the EXV are clear, but since the valve is an electric component, it requires some form of electric or electronic control. The electronic controller fulfills by using electronic sensors.

The sensors involved are pressure transducers and temperature sensors. The controller supplies the necessary power and reads the signal. This electrical signal is converted back to pressure by the controller, which stores an equation to do so. The equation is

effective only for a specific brand and model of transducer, so replacements must be obtained from the manufacturer of the controller. This equation is then combined with a reference table or pressure temperature table stored in the controller for the system refrigerant.
