An electronic fish counter is a device used to monitor and count fish as they pass through a certain point in a river, stream, or another waterway. Resistivity Counters work by detecting changes in electrical resistance caused by the passage of fish through a submerged electrode array. Optical Counters use cameras and image recognition software to count and sometimes identify fish species as they pass through a field of view. Acoustic Counters Utilize underwater sound (sonar) technology to detect and count fish based on echoes returned.

The global Electronic Fish Counter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
