The global Electronic Grade Fluorobenzene market size is predicted to grow from US\$ 82.17 million in 2025 to US\$ 130 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

In 2025, global Electronic Grade Fluorobenzene production reached approximately 12 k tons, with an average global market price of around US\$7,000 per kilogram. Electronic grade fluorobenzene is a high-purity fluoride material used in the electronics industry, with a purity of not less than 99.9%. Fluorobenzene is an aryl fluoride and the simplest of the fluorobenzenes, with the formula C_6H_5F , often abbreviated PhF. A colorless liquid, it is a precursor to many fluorophenyl compounds.

The global electronic grade fluorobenzene market is mainly supported by the continued demand for high-purity fluorinated materials in lithium battery electrolyte systems. Unlike general fine chemicals, this segment places greater emphasis on purity, trace impurity control, moisture control, batch consistency, and downstream qualification. Suppliers need not only reliable fluorination and purification capabilities, but also quality systems that meet the requirements of electronic chemicals and new energy materials customers. As demand grows for batteries used in electric vehicles, energy storage, and high-performance electronics, electrolyte formulations require better safety, cycle life, low- and high-temperature performance, and interfacial stability, which supports the value of high-purity fluorinated aromatic materials. On the supply side, electronic grade fluorobenzene remains a relatively small but technically demanding product category. Competition depends less on nominal capacity and more on feedstock security, process continuity, impurity profile control, customer approval, and delivery reliability. Although short-term capacity additions across the lithium battery materials chain may pressure prices and margins, quality stability and supply security should continue to support

qualified producers.
