Electronic heat exchangers are thermal management tools that are widely used across a variety of industries. Their basic function is to remove heat from designated locations by transferring it into a fluid. Inside the electronic heat exchanger, the heat from this fluid passes to a second fluid without the fluids mixing or coming into direct contact. The original fluid, now cooled, returns to the assigned area to begin the heat transfer process again. Applied to electronics enclosures, electronic heat exchangers draw heated air from a cabinet, cool it, and then return the cooled air to the cabinet.
