An electronic horn is a type of sound-producing device that generates auditory signals using electronic components instead of traditional mechanical means like a vibrating diaphragm or air compression. These horns typically consist of an electronic circuit that generates an alternating current (AC) or pulse-width modulated (PWM) signal, which is then amplified and converted into audible sound waves using a transducer, such as a piezoelectric element or a loudspeaker.

Electronic horns are commonly used in various applications, including automotive vehicles, marine vessels, industrial equipment, and security systems. They offer advantages such as compact size, low power consumption, durability, and the ability to produce a wide range of sounds. Additionally, electronic horns can be easily integrated with electronic control systems, allowing for customized sound patterns, volume control, and remote activation.

The global Electronic Horn market size is projected to grow from US\$ 844 million in 2024 to US\$ 1259 million in 2030; it is expected to grow at a CAGR of 6.9% from 2024 to 2030.
