The global Electronic Multichannel Pipettes market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An electronic multichannel pipette is an instrument used in laboratories to aspirate and dispense multiple liquids simultaneously. It features multiple channels, allowing for the transfer of multiple samples or reagents in a single operation. The working principle of a multichannel pipette is similar to that of a standard pipettor, utilizing the air displacement principle to determine the volume of liquid transferred based on the distance the piston sleeve moves within it. Additionally, it offers various pipetting modes, such as the conventional aspirate and dispense mode, the multi-dispense mode (which divides a set volume of liquid into equal aliquots for multiple dispensing), and the reverse pipetting mode (used for aspirating high-viscosity or volatile liquids), to cater to different experimental requirements.
