The global Electronic Personal Dosimeter market size is predicted to grow from US\$ 3455 million in 2025 to US\$ 5256 million in 2031; it is expected to grow at a CAGR of 7.2% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The electronic personal dosimeter (EPD) is a modern electronic dosimeter for estimating uptake of ionising radiation dose of the individual wearing it for radiation protection purposes. The electronic personal dosimeter has the advantages over older types that it has a number of sophisticated functions, such as continuous monitoring which allows alarm warnings at preset levels and live readout of dose accumulated. It can be reset to zero after use, and most models allow near field electronic communications for automatic reading and resetting.

The global electronic personal dosimeter market is expected to rise as the usage of radiation-mediated technology grows. This is due to the device's ability to detect and monitor radiation. Manufacturers are working to improve the device's technology and functionality so that it can be used in extreme weather and is appropriate for emergency services, medical services, nuclear and mining situations, and the oil and gas industry around the world. In addition, the capacity to monitor doses acquired by cellphones, PCs, and tablets has created a lucrative market for electronic personal dosimeter all around the world.
