The global Electronic System Level(ESL) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

ESL is a chip design and verification method with a higher level of abstraction than RTL. This method can be used to model the performance, function, and power consumption of the chip in the specification definition stage, mid-term, and later stages according to the design requirements of each stage of the chip. Certain parameters or indicators are obtained through simulation, which serve as a reference for chip design and optimization. Because it uses high-level programming language, it has flexible modeling and fast iteration, and can realize models at different levels of abstraction. With the rapid development of the semiconductor industry, electronic system level (ESL) design will become more and more important in the field of high-performance chips with large computing power. important.
