Thermal paste, also known as thermal paste, is a paste-like substance with good thermal conductivity (but mostly non-conductive) that is generally used at the interface between a heat sink and a heat source (such as high-power semiconductor components). The main function of the thermal paste is to remove the air or gap at the interface (the air has poor thermal conductivity), so that the thermal conductivity can be maximized. Thermal paste is a thermal interface material.

The global Electronic Thermal Paste market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.

The global chemical industry is part of the global economic development, and the cyclical economic development envelopes the global chemical industry. In recent years, global economic growth has slowed down, and the growth rate of the chemical industry has also gradually slowed down. The development of emerging economies such as China and India has continued to promote the global chemical industry to maintain a certain development trend in the past few years. In the future, these economies will continue to drive the chemical industry market forward with their large population base and strong domestic demand growth. In addition to the influence of the geopolitical characteristics of the Middle East, the shale gas industry in the United States among developed countries has become the biggest variable in recent years, driving the strong development of the U.S. chemical industry.
