An electrophysiology (EP) laboratory is an operating room or a theatre equipped with high-tech equipment used in the treatment of cardiovascular problems such as arrhythmia, fibrillation, congestive heart failure and stroke among others. EP lab offers patients the opportunity to have their arrhythmia, or irregular heartbeat, tested, diagnosed and treated. An irregular heartbeat can lead to heart complications, fatigue, congestive heart failure or stroke. The EP lab focuses on the electrical function of the heart and treats various conditions on the spot.

Cardiac mapping can map and detect specific electrical activity of the heart in real time. Any electric irregularities can be immediately diagnosed and potentially treated. Ablation studies can identify a patient's electrophysiological weaknesses and diagnose diseases to provide suitable preventive measures. This non-surgical, minimally invasive process involves threading a small catheter into the heart. Electric impulses are studied and then potentially blocked or treated to create a regular rhythm in the heart. Defibrillator implantation are for those with a dangerously irregular heart rhythm and a very high risk of cardiac death. In such cases, cardiologists may choose to implant a defibrillator. This device can detect a dangerous rhythm and shock the heart back into regular pace. The device is implanted into a small incision near the heart and connected electrically to the heart. Cardiac electrophysiology assists the diagnosis and treatment of arrhythmias which causes abnormal electrical activities in heart.
