Electrophysiology Lead is to send the electrode catheter into the specific part of the cardiac cavity through the vein or arterial blood vessel, and release the high-frequency sinusoidal alternating current of 30KHz~1000KHz, which will cause the coagulation necrosis of the local endocardium and subendocardial myocardium, thereby blocking the flow. Interventional techniques for interrupting abnormal conduction bundles and origins of tachyarrhythmias. The damage range of the RF current introduced into the cardiac cavity through the catheter is 1-3mm², which will not cause harm to the body.
