The global Electroplating Grade PC/ABS Alloy market size is predicted to grow from US$ 2002 million in 2025 to US$ 2749 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

Electroplating grade PC/ABS alloy requires good adhesion between the metal coating and the substrate. Electroplating grade PC/ABS alloy is an alloy made by blending polycarbonate (PC) and acrylonitrile-butadiene-styrene copolymer (ABS). PC is a very common substrate in engineering plastics. Its advantages are high mechanical strength and strong impact resistance, but poor fluidity and easy cracking. As one of the general plastics, ABS has good electroplating performance and strong corrosion resistance, but low impact resistance. Therefore, the composite of PC and ABS provides a new direction for the modification of engineering plastics. The mixed PC/ABS material not only has the good impact resistance and formability of ABS material, but also has excellent impact resistance and heat resistance of PC, and is widely used in automotive accessories, electronics and other products. The reason why PC/ABS can be electroplated is that the rubber component (B) is etched by chromic acid/concentrated sulfuric acid, which makes the surface of the material present microscopic roughness, increases the contact area between the coating and the plastic substrate, and thus forms a large number of holes, which play an anchoring role, so as to facilitate the subsequent sensitization activation and chemical nickel or copper plating. Therefore, generally speaking, the rubber content in electroplating grade PC/ABS will be significantly higher than that in ordinary grade PC/ABS.

United States market for Electroplating Grade PC/ABS Alloy is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
