The global Electropolishing Technology market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Electropolishing technology is an electrochemical process used for the surface refinement of metal objects. Typically applied to stainless steel, this technique removes a controlled amount of material from the surface through an electrolytic bath. During electropolishing, the metal object serves as the anode, and it is immersed in a specially formulated electrolyte solution. The application of electrical current leads to the selective dissolution of microscopic high points on the metal surface, resulting in a smooth, polished finish. Electropolishing not only enhances the aesthetic appearance of metal parts by reducing surface roughness and micro-irregularities but also provides functional benefits such as improved corrosion resistance, reduced friction, and increased resistance to fatigue and stress corrosion cracking. This technology is widely used in industries such as medical device manufacturing, aerospace, electronics, and automotive for producing high-quality, clean, and corrosion-resistant metal components.

United States market for Electropolishing Technology is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
