The gross profit margin of major companies in the industry is between 28% ? 46%.

In 2025, the global production capacity of Electrostatic Dust Detector was approximately 516,667 units.

Electrostatic Dust Detector is an instrument that detects dust concentration or particle flow by measuring electrostatic charge signals generated when particles pass through or contact sensing components. It is used for industrial emission monitoring, dust collector performance checking, process safety, and environmental compliance.

The industrial chain includes upstream electrodes, sensors, signal processors, housings, display units, calibration tools, and communication modules. Midstream covers detector design, assembly, signal calibration, environmental testing, and quality inspection. Downstream applications mainly include power plants, cement plants, metallurgy, chemical plants, dust collectors, and environmental monitoring systems.

Strict environmental emission standards and industrial air quality supervision requirements promote the application of electrostatic dust detectors. With high detection sensitivity and stable real-time monitoring capability, it is widely used in factory flue gas,

environmental monitoring and industrial dust prevention scenarios. Intelligent data transmission and automatic calibration functions further improve detection accuracy.
