The report requires updating with new data and is sent in 48 hours after order is placed.

Electrostatic headphones are frequently considered the most transparent, natural, detailed sounding listening devices possible. This is due to the extremely quick transient response of their ultra-thin driver elements, which unlike traditional headphone and speaker drivers, lack heavy wire coils and magnets. Instead, the electrostatic driver is charged with a high DC bias voltage (typically 580V on most models), and moves in response to a high voltage electric field created by opposing stators on either side.

The global Electrostatic Headphones market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
