The global Electrostatic Permanent Air Filter market size is predicted to grow from US$ 1013 million in 2025 to US$ 1444 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

An Electrostatic Permanent Air Filter is a reusable filtration device that captures airborne particles such as dust, pollen, smoke, and pet dander using the principle of static electricity rather than disposable filter media. It typically consists of multiple layers of metal mesh (aluminum or stainless steel) or synthetic fibers that generate an electrostatic charge as air flows through, attracting and trapping particulates while allowing clean air to pass. The filter can be washed and reused, offering long service life and reduced waste compared to disposable filters. Its supply chain begins with the production of metal meshes, synthetic electrostatic fibers, and aluminum frames, followed by assembly and coating processes performed by specialized HVAC component manufacturers. Midstream, filters are integrated into residential, commercial, and industrial HVAC systems through OEM and aftermarket channels, while downstream distribution involves HVAC service companies, retailers, and maintenance contractors supplying end users such as homes, office buildings, hospitals, and manufacturing facilities. In 2024, global Electrostatic Permanent Air Filter output was about 24 million units, with a capacity near 30 million units. Prices ranged from USD 35–420 per unit, and the market maintained an average gross margin of 31%.

United States market for Electrostatic Permanent Air Filter is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
