The global Electrostatic Removal Equipment market size is predicted to grow from US\$ 492 million in 2025 to US\$ 693 million in 2031; it is expected to grow at a CAGR of 5.9% from 2025 to 2031.

Electrostatic eliminator refers to a device that generates a certain amount of high voltage through a high-voltage power generator and applies it to a discharge needle. Due to the tip discharge effect, the air around the discharge needle is ionized and an equal amount of positive and negative ions are generated. Through the airflow, the equal amount of positive and negative ions are sent to the space or object that needs to eliminate static electricity, where positive ions are neutralized with negative static electricity, and negative ions are neutralized with positive static electricity to achieve the goal of eliminating static electricity and preventing static electricity generation. An electrostatic eliminator can also be called an electrostatic device, and its principle is as follows. It consists of a high-voltage power generator and a discharge electrode (usually made of ion needles), which ionizes the air into a large number of positive and negative ions through a high-voltage corona discharge at the tip. Then, a large number of positive and negative ions are blown to the surface of the object by wind to neutralize static electricity, or the static electricity eliminator is directly placed near the surface of the object to neutralize static electricity.
