The global Electrostatic Shielding Cardboard market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Electrostatic shielding cardboard is a material that can effectively reduce ground interference and improve the system's anti-interference ability. In power equipment such as transformers, it is often used as key components such as windings, layered insulation and shielded windings to protect the inside of the equipment from the influence of external electrostatic fields, while preventing the electrostatic field generated inside the equipment from interfering with the outside world.

The principle of electrostatic shielding is based on the state of electrostatic equilibrium. When a conductor (here, the cardboard material is specially treated to be conductive) is in an external electric field, the free charge inside it will be redistributed until a dynamic equilibrium state is reached, that is, the internal field strength is zero everywhere. In this way, the conductor shell (or cardboard) protects the area it encloses from the influence of the external electric field.

United States market for Electrostatic Shielding Cardboard is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Electrostatic Shielding Cardboard is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Electrostatic Shielding Cardboard is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
