The global Electrostrictive Material market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Electrostrictive materials are similar to piezoelectric materials because they are ferroelectric crystals, which exhibit a dimensional change upon an applied electric field or an electric polarization in an applied mechanical stress.

However, electrostrictive actuators use a lead-magnesium-niobate (PMN) crystal stack while piezoelectric actuators use lead-zirconate-titanate (PZT)-based ceramics. Electrostrictive transducers are used in a number of applications that include adaptive optic systems, scanning tunneling microscopes, and precision micropositioners.
