The global Elevated Runway Guard Light market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An Elevated Runway Guard Light (ERGL) is a warning light that is positioned at the entrance to a runway to indicate when it is unsafe for an aircraft or vehicle to enter or cross. The light is typically mounted on a tall pole or tower alongside the runway and is usually made up of a set of red and green lights that alternate.

When the ERGL is illuminated with a red light, it indicates that the aircraft or vehicle must stop and wait until the light changes to green. This is because it is unsafe for them to enter or cross the runway due to the presence of aircraft landing or taking off.

The ERGL is an important safety feature at airports, helping to prevent collisions on the runway and ensuring that aircraft and vehicles can move safely around the airport. In addition to the ERGL, there are other runway lighting systems that are used to guide pilots during takeoff and landing, including edge lights, threshold lights, and touchdown zone lights.
