An embedded IoT gateway refers to a specialized hardware device or software application that serves as a bridge between IoT (Internet of Things) devices and the cloud or other network infrastructure. It is typically deployed within IoT ecosystems to aggregate, process, and transmit data collected from connected devices to centralized servers or cloud platforms for further analysis, storage, and management. Embedded IoT gateways are equipped with various communication interfaces such as Wi-Fi, Ethernet, Bluetooth, Zigbee, or cellular connectivity, allowing them to communicate with a wide range of IoT devices and sensors. These gateways often feature embedded computing capabilities, including processors, memory, and storage, enabling them to perform local data processing, filtering, and aggregation tasks before transmitting the data to the cloud. Additionally, embedded IoT gateways may support security features such as encryption, authentication, and access control to ensure the integrity and confidentiality of IoT data. Overall, embedded IoT gateways play a crucial role in enabling secure, reliable, and scalable connectivity within IoT deployments, facilitating real-time monitoring, control, and automation of connected devices and systems.

The global Embedded IoT Gateway market size is projected to grow from US\$ 4654 million in 2024 to US\$ 9305 million in 2030; it is expected to grow at a CAGR of 12.2% from 2024 to 2030.
