Embedded vision systems have brought to life new applications with never-before-seen capabilities. From life sciences and manufacturing and sports broadcasting, they form the backbone of critical functions across many industries – delivering innovation to meet evolving market expectations. The two basic criteria to assess the effectiveness of an embedded vision system are:

Seamless and high-quality image capturing

Smooth and quick image processing

When designing an embedded vision system, choosing the right interface is a moment of truth. The interface plays a crucial role in determining its success because it is responsible for transmitting images from the camera to the processing system. Simply put, it is the physical connection layer that connects a camera to the processing platform for image processing. Two defining characteristics include proper throughput and suitable distance. The interface also influences the platform selection process since each one has its own interfacing limitations.
