Abstracts

The global Embodied Intelligent Robot Control System market size is predicted to grow from US\$ 175 million in 2025 to US\$ 3423 million in 2032; it is expected to grow at a CAGR of 53.9% from 2026 to 2032.

The embodied intelligent control system is an advanced artificial intelligence technology that allows intelligent agents to realize the three main links of "perception, decision-making, and control" through the interaction of the physical body and the environment. It mainly functions in two parts: the first is the "brain" of the humanoid robot based on the large artificial intelligence model, which is mainly reflected in environmental perception, behavior control, human-computer interaction, etc.; the second is the "cerebellum" that controls the movement of the humanoid robot, which is mainly reflected in its motion control aspect. Its system architecture is divided into: bottom transmission equipment, operating system communication protocol stack, motion control system construction, and algorithm library construction from the perception layer, middle layer, decision-making layer to control layer.
