EMI board-level shielding is a shielding solution used to reduce electromagnetic interference (EMI) generated by specific areas or components on a circuit board. They are usually made of metal to form a closed shielding cover to prevent the propagation of electromagnetic waves. Suitable for consumer electronics, automotive electronics, IoT devices, telecommunications equipment, etc.

The global EMI Board Level Shields market focuses on the design and production of shielding components mounted directly on printed circuit boards (PCBs) to reduce electromagnetic interference and ensure signal integrity. These shields?typically made of stamped metal, formed mesh, or multilayer materials?are widely used in smartphones, automotive electronics, 5G infrastructure, medical devices, and IoT equipment. With rising demand for miniaturized and high-frequency electronic systems, manufacturers are shifting toward lighter, thinner, and customizable shields to meet stricter regulatory standards and improve device performance. This market shows steady growth, driven by both consumer electronics expansion and the proliferation of connected industrial equipment.
