EMI Power Line Filters are devices used to suppress electromagnetic interference and are usually installed on the power lines of electronic equipment. Its main function is to prevent high-frequency electromagnetic interference signals from other equipment or power lines from entering the inside of the equipment through the power line, and at the same time reduce the propagation of high-frequency electromagnetic interference signals generated by the equipment to external power lines.

These filters are usually composed of capacitors, inductors and resistive components, through which electromagnetic interference signals of different frequencies are filtered and attenuated. This helps ensure that the device is not affected by external electromagnetic interference when operating and does not cause interference to other

devices.

EMI Power Line Filters are widely used in the fields of industrial equipment, communication equipment, medical equipment and household electronic products, helping to improve the anti-interference ability of the equipment, ensuring the normal operation of the equipment and meeting relevant electromagnetic compatibility standards.
