Emission Trading Schemes are market-based approach to controlling pollution by providing economic incentives for achieving reductions in the emissions of pollutants.

An Emissions Trading Scheme (ETS) is a market-based, cost-effective approach to reducing greenhouse gas (GHG) emissions. Governments economically incentivise firms, corporations, and other entities to cut emissions by setting a limit on emissions and issuing permits within the limit that each allows for one tonne of GHG emissions. Permits must be obtained, either from the government or through trade with other firms, and surrendered per unit of emissions. The cap is lowered over time to ensure emissions fall. Firms, therefore, if insufficient in their quantity of permits, must either

reduce emissions or purchase more permits – with a given permit price always equals to one tonne of CO₂.
